CARMA: Community Aerosol & Radiation Model for Atmospheres

- Fully resolved size distributions
- From first principles
- Time dependent

Microphysics

Nucleation

Condensation

Coagulation

Roadmap

1. Clouds on **Hot Jupiters**:

Powell, D., et al. 2018, ApJ, 860, 18

2. Clouds on **Brown Dwarfs**:

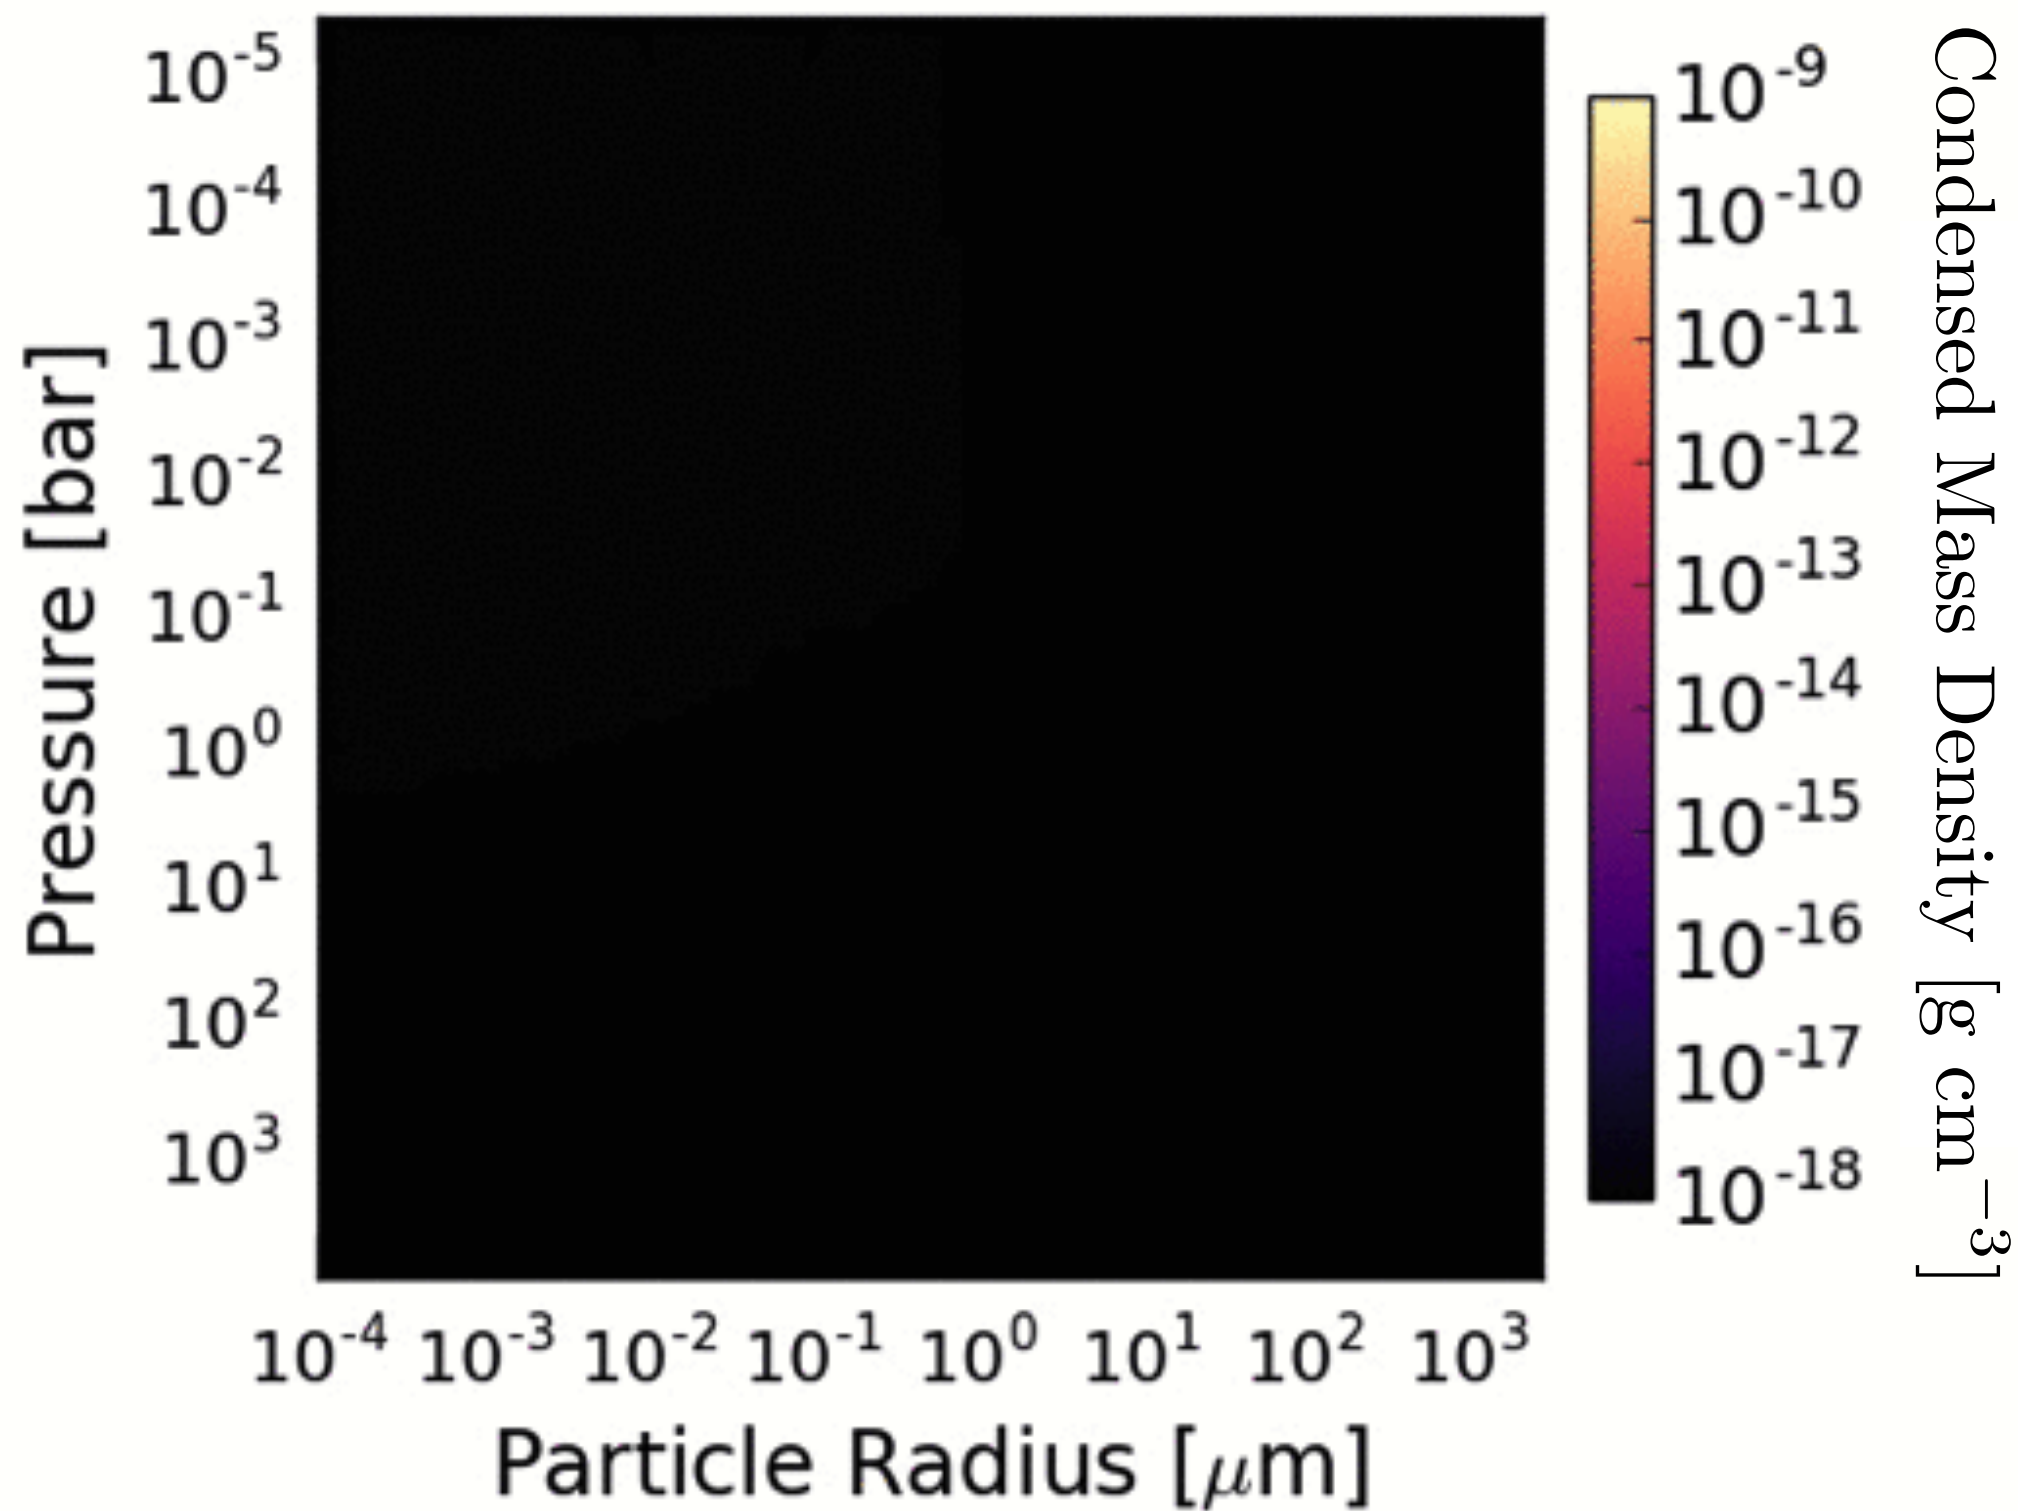

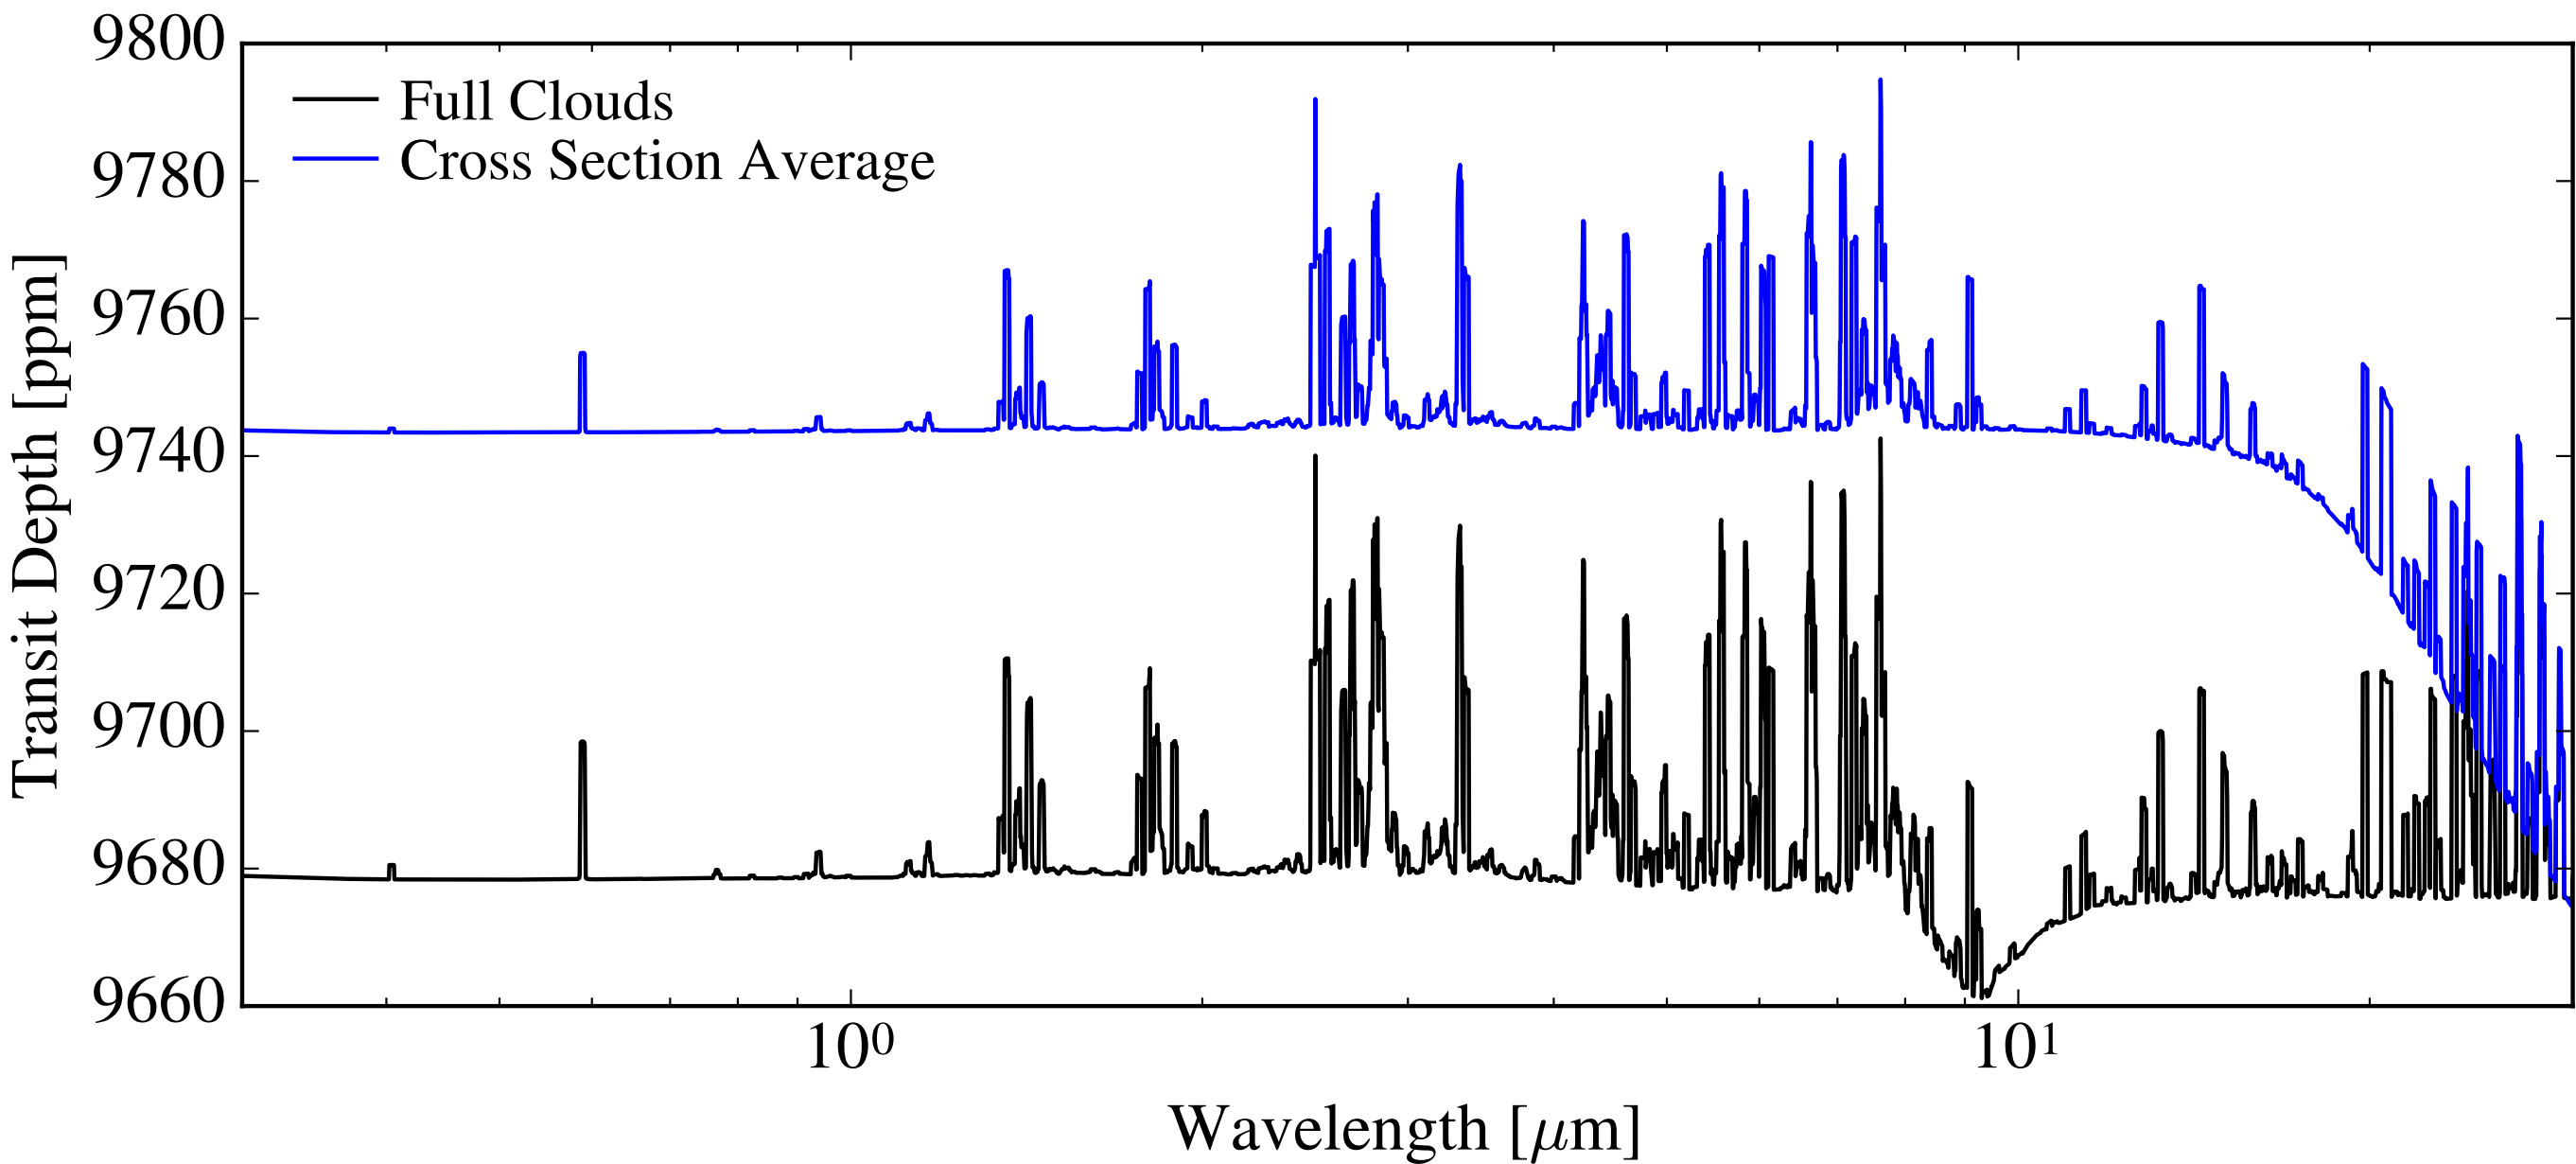

image: NASA/JPL-Caltech

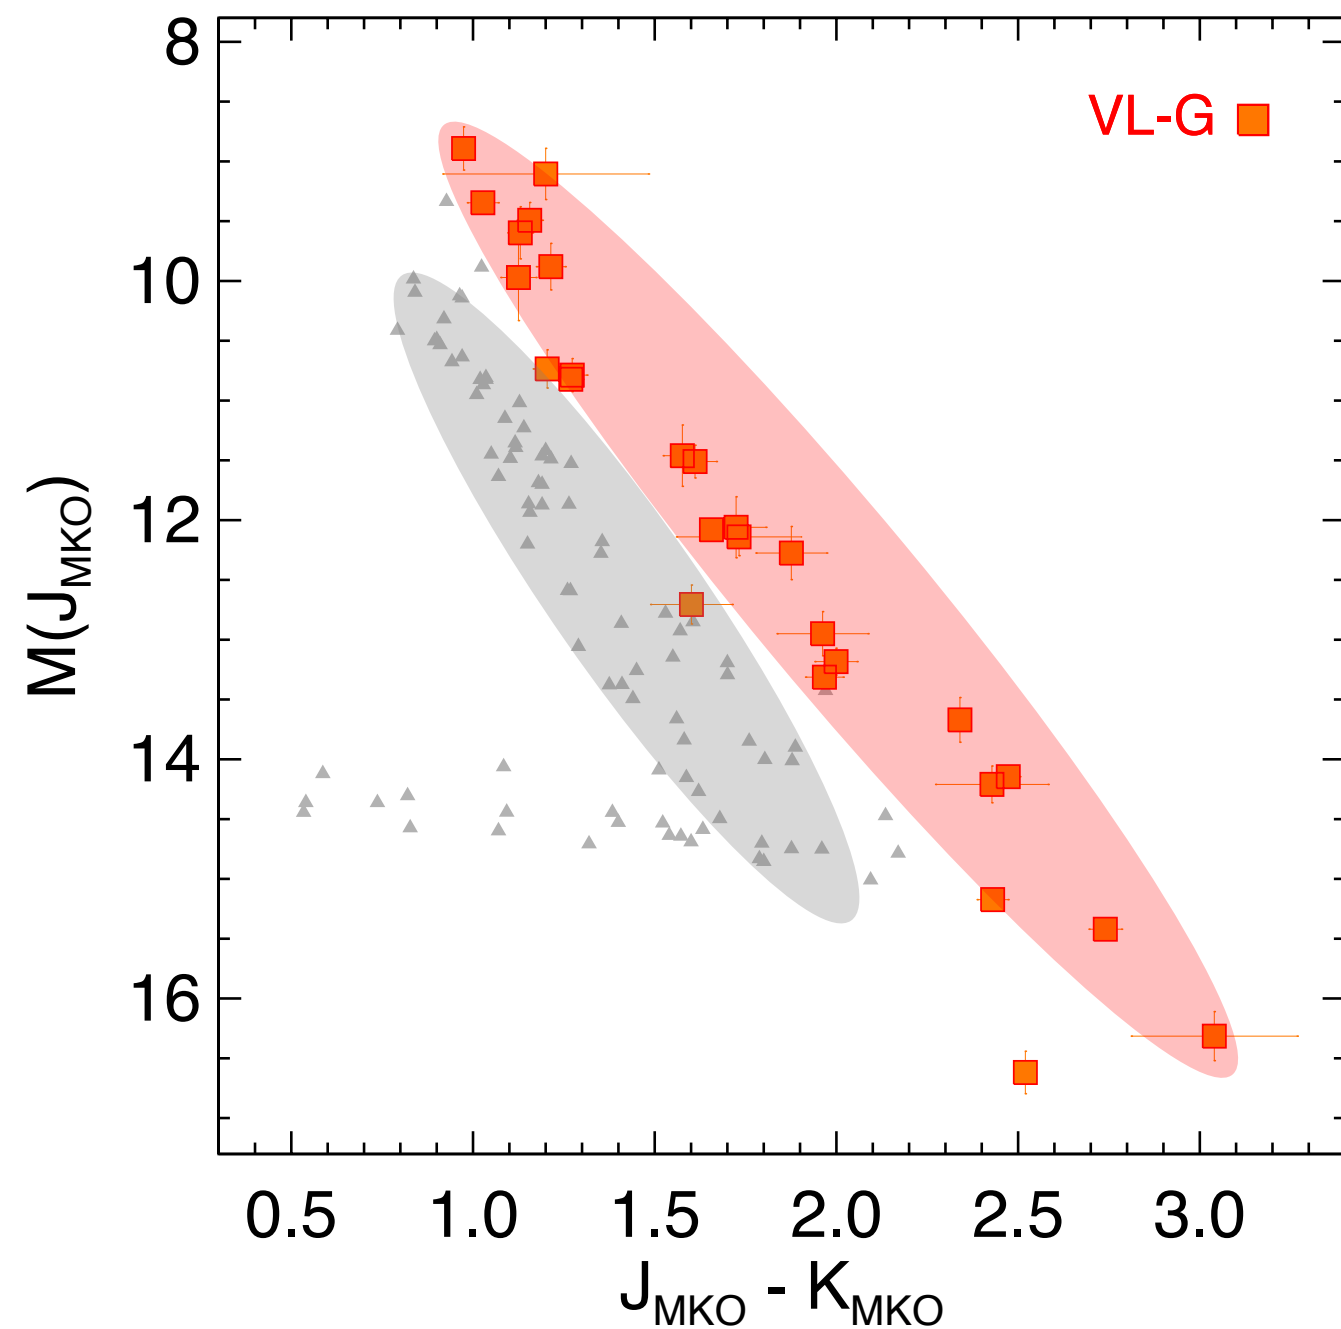

1 frame = 1 Earth month

Considering the full particle size distribution distinctly changes the transmission spectra

Very Low Gravity Brown-Dwarfs

Preliminary

$$\log(g) = 4$$

$$T_{\text{eq}} = 1100 - 1600 \text{ K}$$

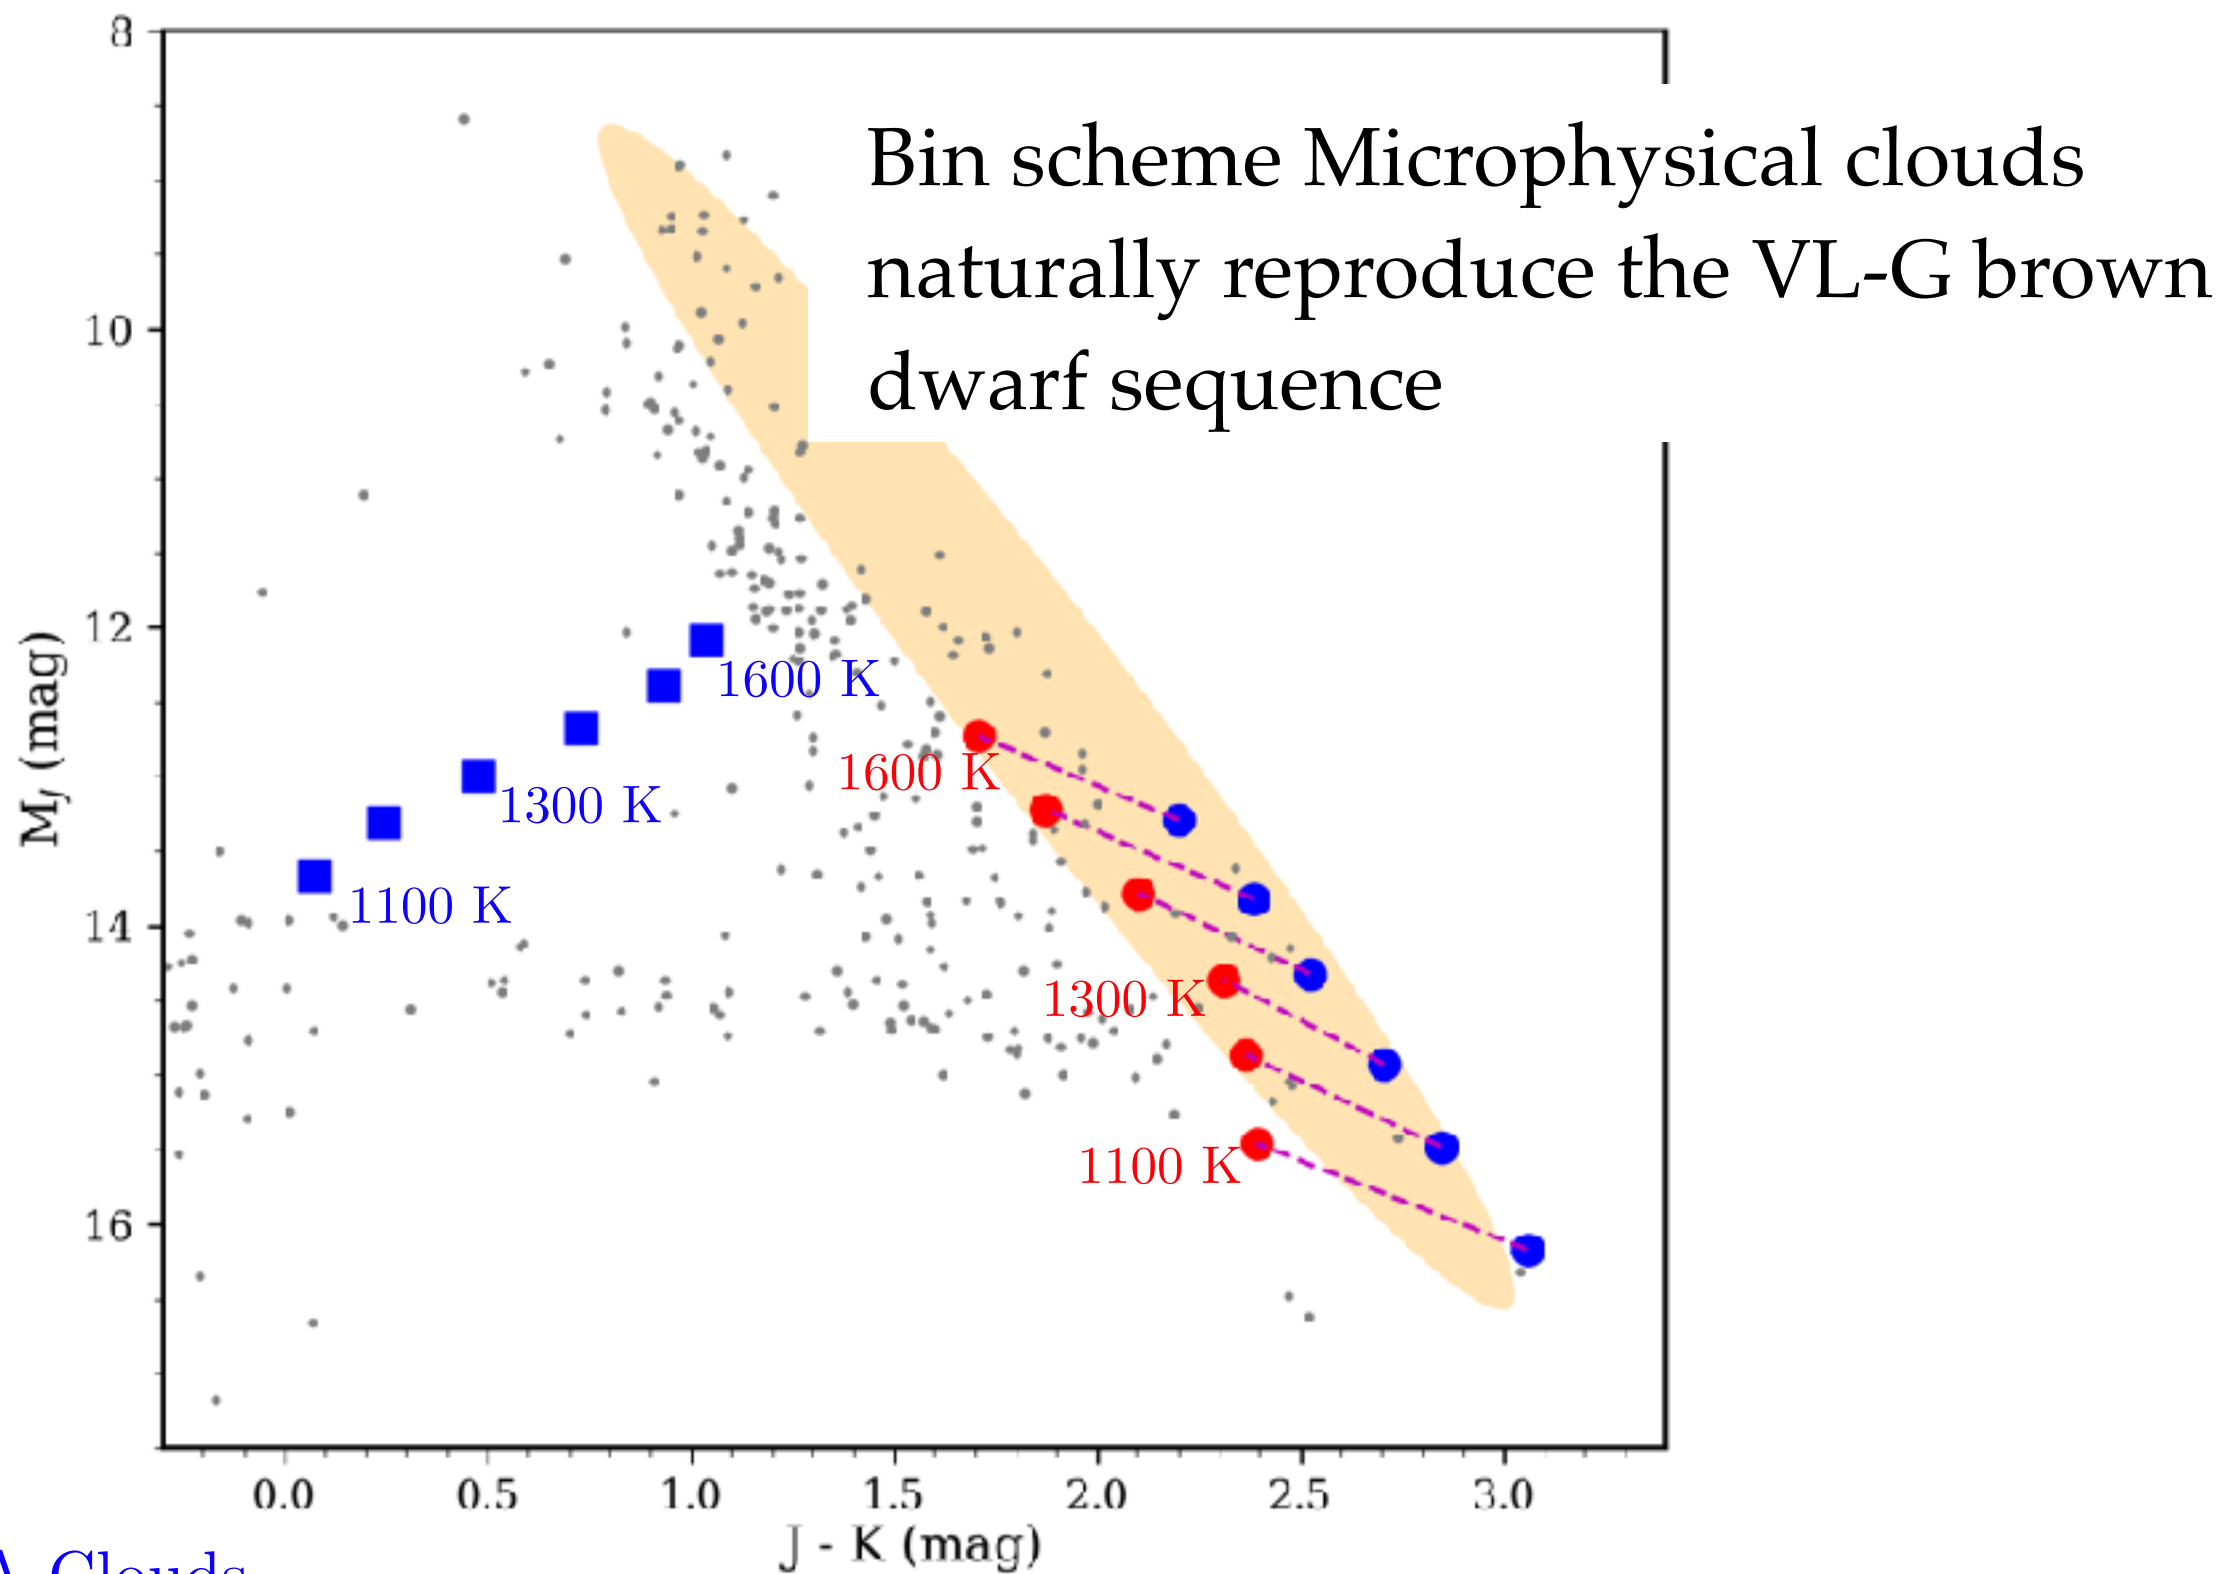

Flattened Emission Spectra

$$\log(g) = 4$$

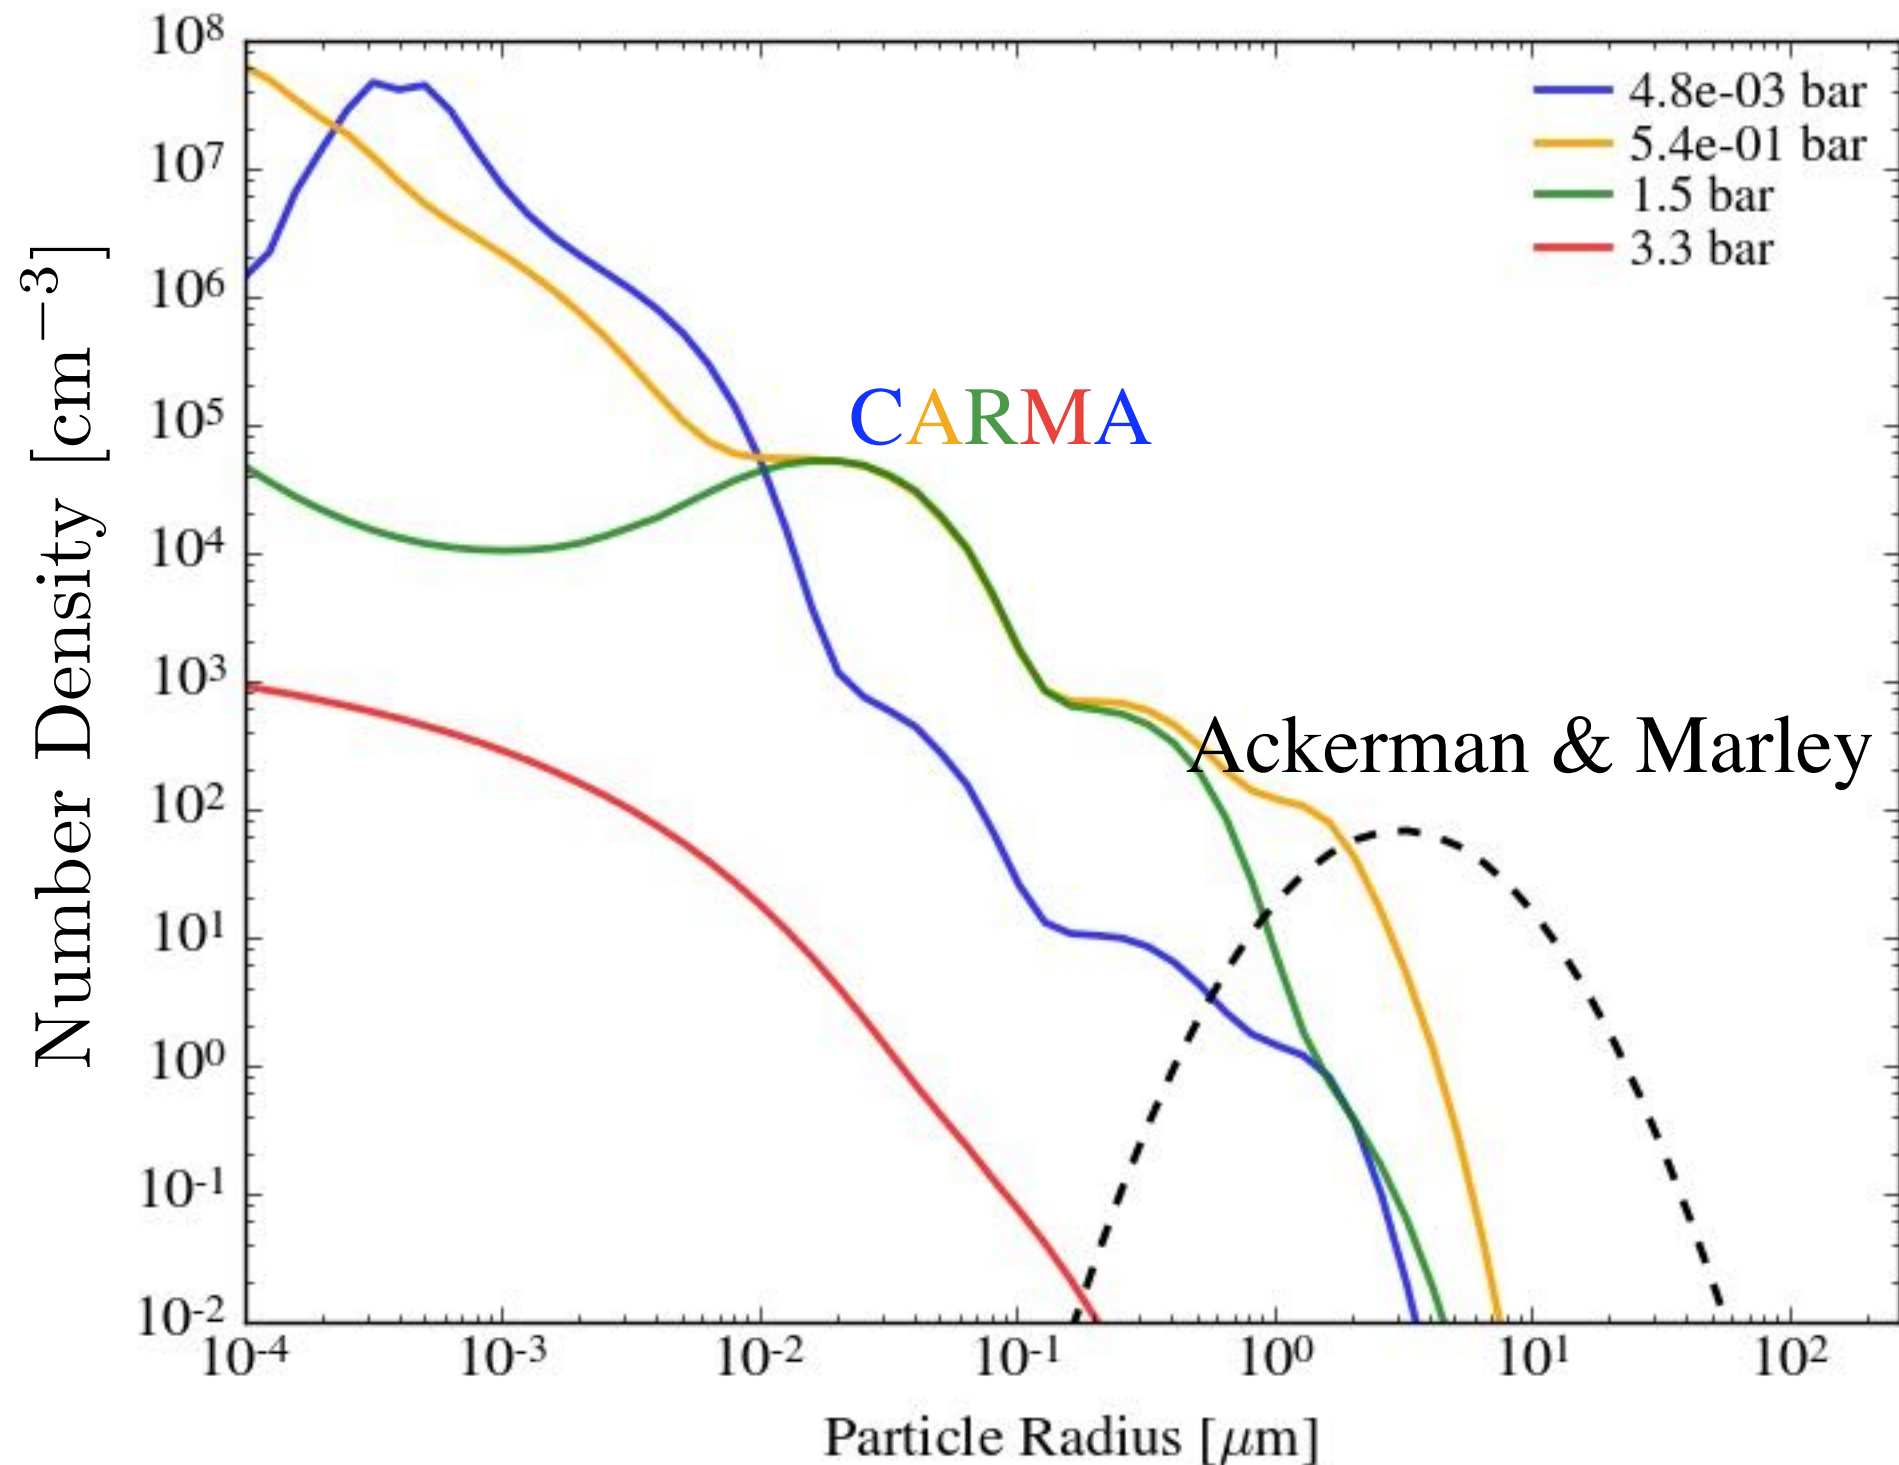

$$T_{\text{eq}} = 1100 \text{ K}$$

Very Low Gravity CMD

- = CARMA Clouds
- = Ackerman & Marley Clouds
- = Clear Atmosphere

Why are these cloud models giving different answers?

What about normal gravity brown dwarfs?

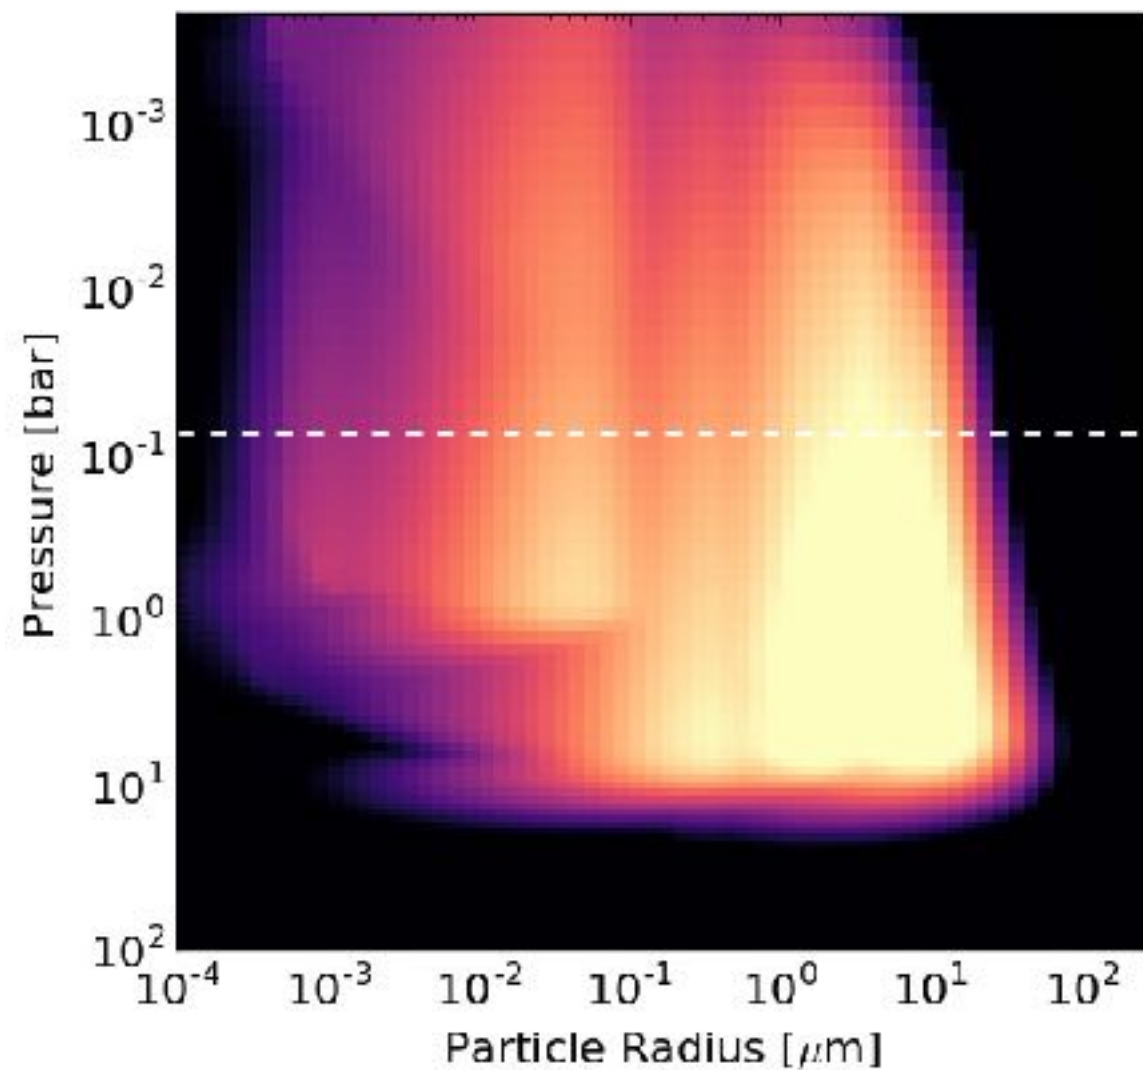

- = CARMA Clouds
- = Ackerman & Marley Clouds
- = Clear Atmosphere

$$T_{\text{eq}} = 1700 \text{ K}$$
$$\log(g) = 5$$

Where are the clouds?

Normal-g Brown Dwarf

$$\log(g) = 5$$

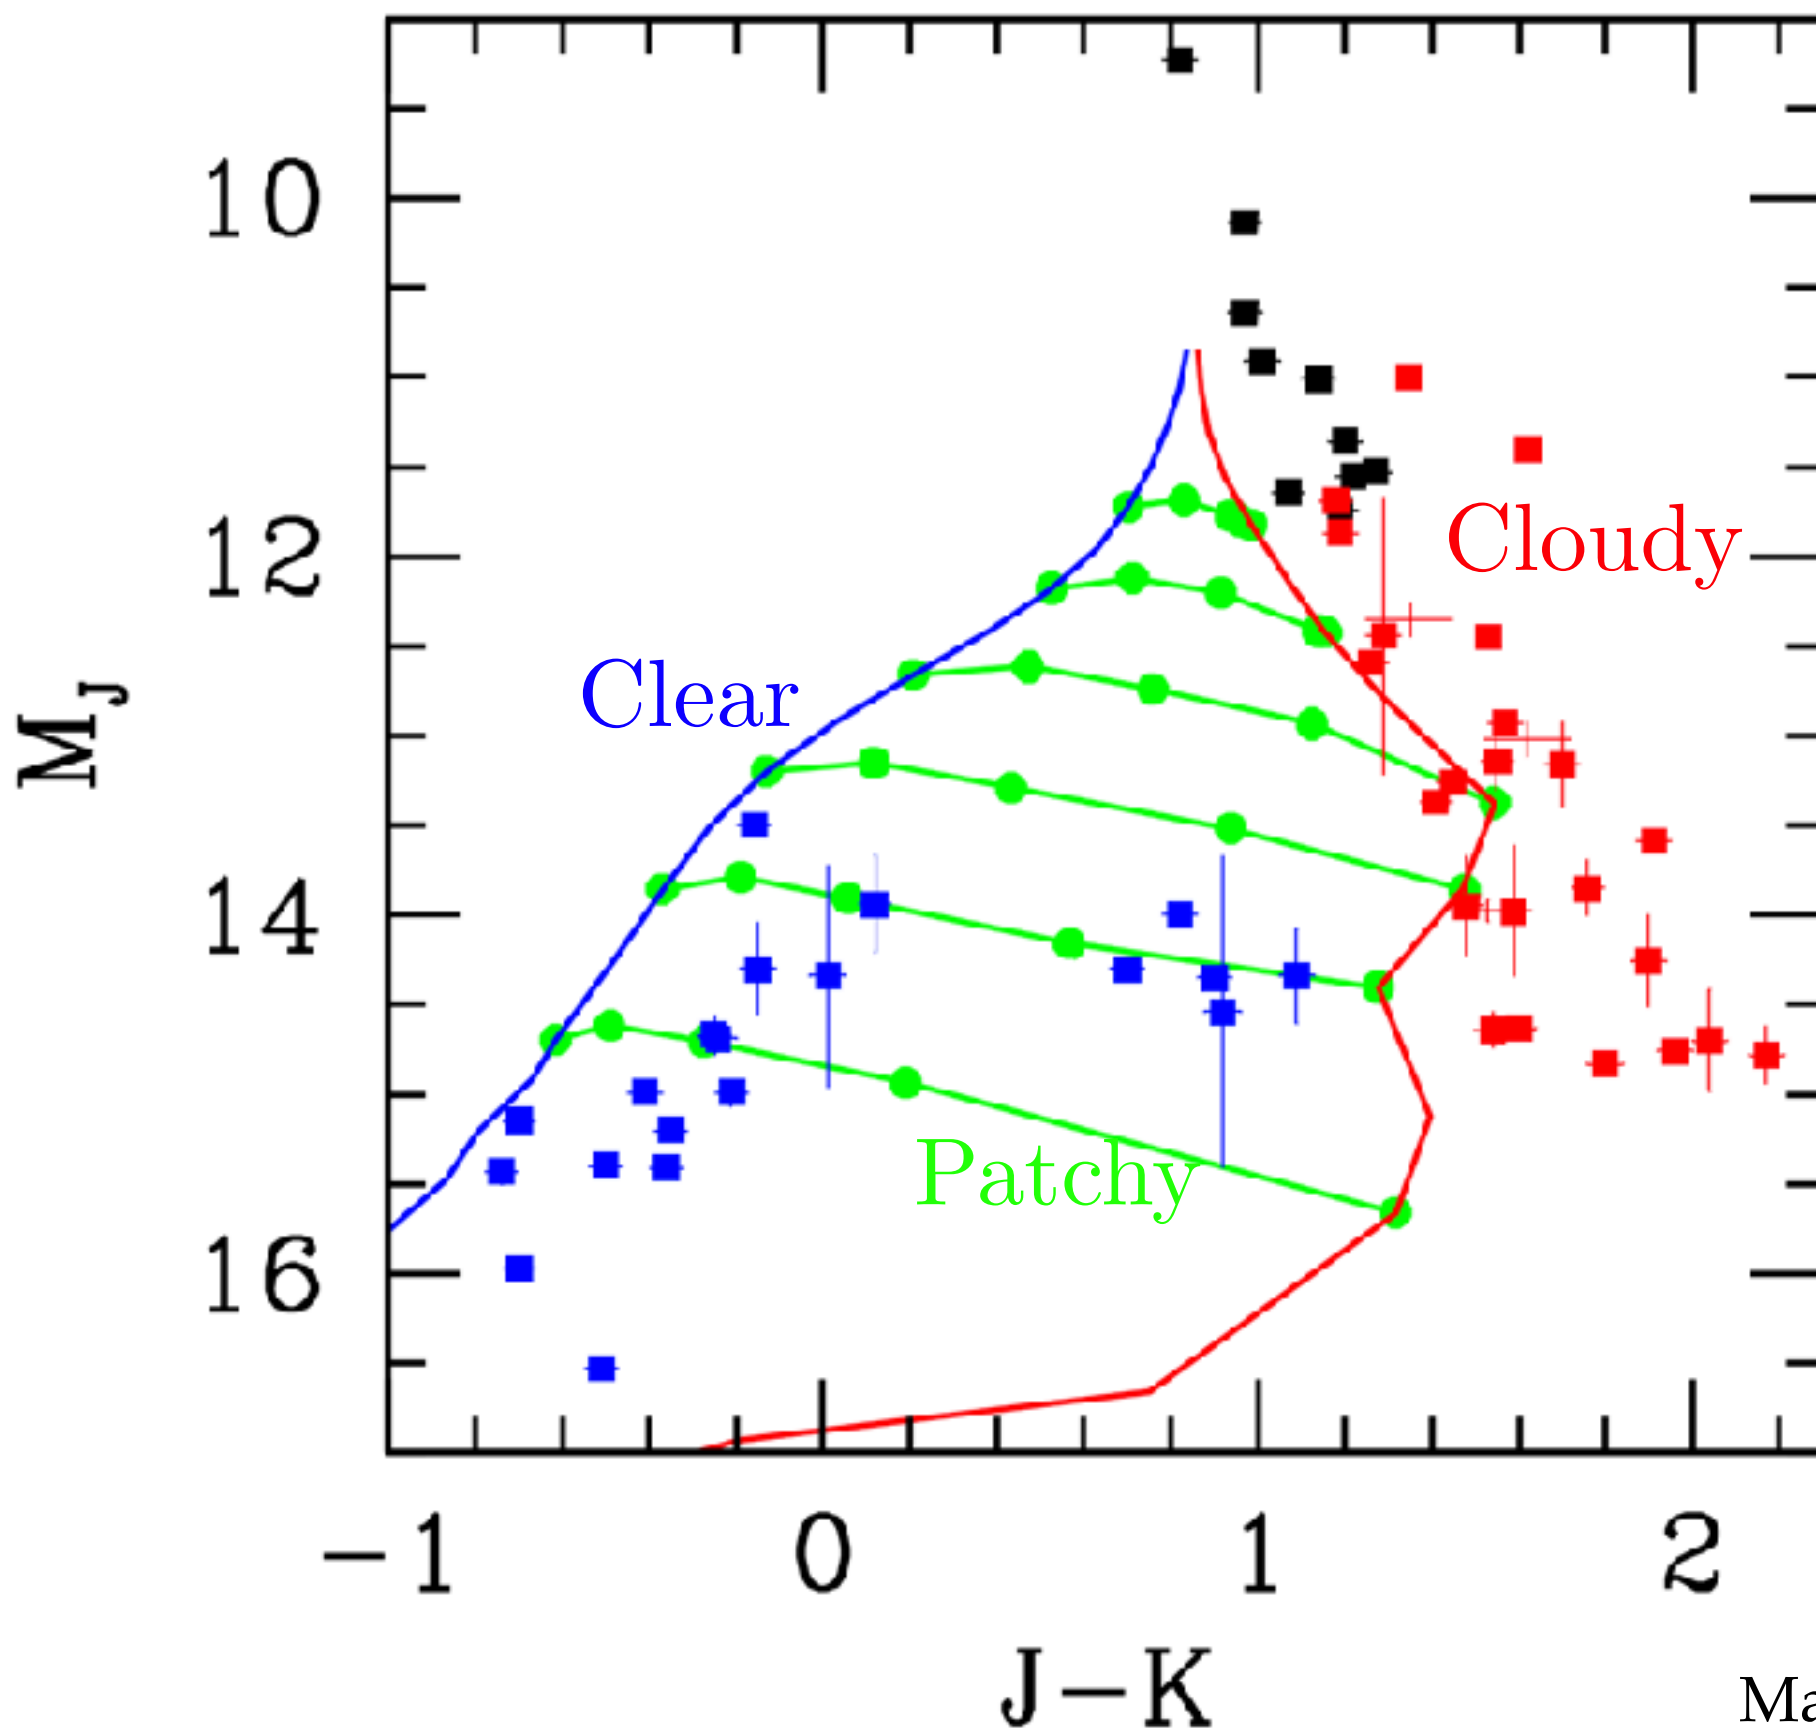

Very Low-g Brown Dwarf

$$\log(g) = 4$$

$$T_{\text{eq}} = 1600 \text{ K}$$

The Effect of 3D Cloud Structure

Upcoming Work

- 3D Cloud Structure

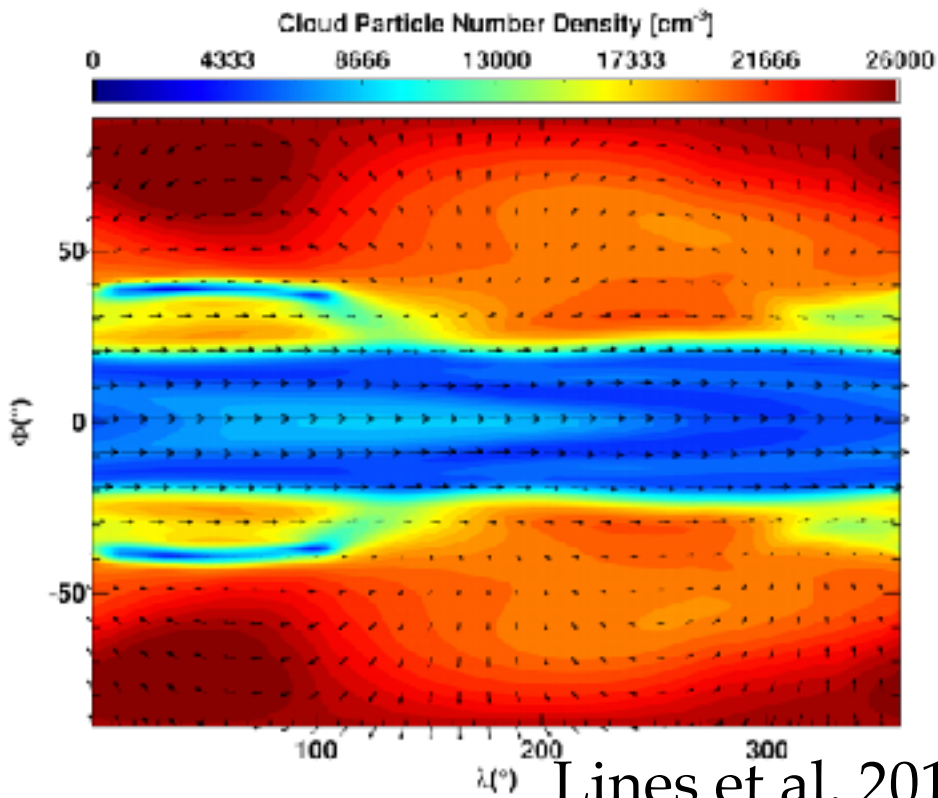

- Self-consistent cloud radiative effects

Clouds moving forward

3D Studies

Lines et al. 2018

and much,
much more!

Broad wavelength Observations

Laboratory Experiments

Hörst et al. 2018

Conclusions

- ▶ Cloud properties depend strongly on planetary (or brown dwarf) properties
- ▶ Considering fully resolved particle size distributions is important in spectral models
- ▶ Preliminary results suggest that the bin-scheme microphysical model of clouds naturally reproduces the VL-G brown dwarf sequence
- ▶ Stay tuned for model updates and final results!
